

Spring 2019 COMP 3511 Homework Assignment #3
Handout Date: March 30, 2019 Due Date: April 12, 2019

Name: _____ ID: _____ E-Mail: _____

Please read the following instructions carefully before answering the questions:

- You should finish the homework assignment **individually**.
- There are total of **4** questions.
- When you write your answers, please try to be precise and concise.
- Fill in your name, student ID, email and Section number at the top of each page.
- Please fill in your answers in the space provided.

- **Homework Collection:** the homework is submitted to **assignment #3** on CASS

1. [20 points] Multiple choices

1) The first readers-writers problem ____.

- A) requires that, once a writer is ready, that writer performs its write as soon as possible.
- B) is not used to test synchronization primitives.
- C) requires that no reader will be kept waiting unless a writer has already obtained permission to use the shared database.
- D) requires that no reader will be kept waiting unless a reader has already obtained permission to use the shared database.

Answer: __

2) Which of the following conditions must be satisfied to solve the critical section problem?

①Aging ②Mutual Exclusion ③Deadlock ④Progress ⑤Bounded Waiting

A) ①②③⑤

B) ②③④⑤

C) ②④⑤

D) ③④⑤

Answer: __

3) Assume an adaptive mutex is used for accessing shared data on a Solaris system with multiprocessing capabilities. Which of the following statements is not true?

- A) A waiting thread may spin while waiting for the lock to become available.
- B) A waiting thread may sleep while waiting for the lock to become available.
- C) The adaptive mutex is only used to protect short segments of code.
- D) Condition variables and semaphores are never used in place of an adaptive mutex.

Answer: __

4) _____ occurs when a higher-priority process needs to access a data structure that is currently being accessed by a lower-priority process.

- A) Deadlock
- B) Priority inversion
- C) A race condition
- D) A critical section

Answer: __

5) A deadlocked state occurs whenever _____.

- A) a process is waiting for I/O to a device that does not exist
- B) the system has no available free resources
- C) every process in a set is waiting for an event that can only be caused by another process in the set
- D) a process is unable to release its request for a resource after use

Answer: __

6) Which of the following condition is required for deadlock to be possible?

- A) Mutual exclusion
- B) A process may hold allocated resources while awaiting assignment of other resources.
- C) No resource can be forcibly removed from a process holding it.
- D) All of the mentioned.

Answer: __

7) Suppose that there are three processes and ten resources of the same type. The current resource allocation and the maximum need of each process is given below, which of the following correctly characterizes this state?

Process	Maximum Needs	Current Allocation
P0	10	4
P1	3	1
P2	6	4

- A) It is not safe.
- B) It is safe.
- C) The state cannot be determined.
- D) It is an impossible state.

Answer: __

8) Absolute code can be generated for ____.

- A) compile-time binding
- B) load-time binding
- C) execution-time binding
- D) interrupt binding

Answer: __

9) Which of the following is true of compaction?

- A) It can be done at assembly, load, or execution time.
- B) It is used to solve the problem of internal fragmentation.
- C) It cannot shuffle memory contents.
- D) It is possible only if relocation is dynamic and done at execution time.

Answer: __

10) ____ is the dynamic storage-allocation algorithm which results in the largest leftover hole in memory.

- A) First fit
- B) Best fit
- C) Worst fit
- D) None of the above

Answer: __

2. [30 points] Synchronization

- 1) Some semaphore implementations provide a function `getValue()` that returns the current value of a semaphore. This function may, for instance, be invoked prior to calling `wait()` so that a process will only call `wait()` if the value of the semaphore is > 0 , thereby preventing blocking while waiting for the semaphore. For example:

```
if (getValue(&sem) > 0)
    wait(&sem);
```

What is the problem in this approach? (5 points)

2) Briefly describe what a reader-writer lock is for and why it can be more efficient than semaphores in some cases. (5 points)

3) Considering the first reader-writer solution below, please explain which semaphores that readers and writers are waiting on when there is a writer in inside the Critical Section updating shared data. (5 points)

Writer	Reader
<pre>do { wait(rw_mutex); ... /* writing is performed */ ... signal(rw_mutex); } while (true);</pre>	<pre>do { wait(mutex); read_count++; if (read_count == 1) wait(rw_mutex); signal(mutex) ... /* reading is performed */ ... wait(mutex); read_count--; if (read_count == 0) signal(rw_mutex); signal(mutex); } while (true);</pre>

- 4) Given a condition variable *x*, Consider the following implementation of *x.signal()* using semaphores. Please explain whether this a Hoare monitor or Mesa monitor, and why? (5 points)

```
if (x_count > 0) {  
    next_count++;  
    signal(x_sem);  
    wait(next);  
    next_count--;  
}
```

- 5) You are asked to implement a different reader-writer solution. There are two classes of processes accessing shared data, *readers* and *writers*. Readers never modify data, thus multiple readers can access the shared data simultaneously. Writers modify shared data, so at most one writer can access data (no other writers or readers). This solution gives priority to writers in the following manner: when a reader tries to access shared data, if there is a writer accessing the data or if there are any writer(s) waiting to access shared data, the reader must wait. In another word, readers must wait for all writer(s) if any to update shared data -- a reader can access shared data only when there is no writer either accessing or waiting.

Variables:

```
State variables (protected by a lock called "lock"  
condition okToRead = NIL; /* readers waiting queue */  
condition okToWrite = NIL; /* writers waiting queue */  
int R_count = 0; /* number of readers accessing data */  
int W_count = 0; /* number of writer accessing data */  
int WR_count = 0; /* number of readers waiting */  
int WW_count = 0; /* number of writers waiting*/
```

The writer code is given below. Please design the Reader's code. (10 points)

```
Writer() {
    // Writer tries to enter
    lock.acquire();
    while ((R_count + W_count) > 0) { // Is it safe to write?
        WW_count++; // Update the counter of waiting writers
        okToWrite.wait(&lock); // Waiting on condition variable,
                               // atomically release the lock, regain the lock later
        WW_count--; // No longer waiting
    }
    W_count++; // Writer inside
    lock.release();

    // Perform actual read/write access

    // Writer finishes update
    lock.acquire();
    W_count--; // No longer active
    if (WW_count > 0) { // Give priority to writers
        okToWrite.signal(); // Wake up one writer
    } else if (WR_count > 0) { // Otherwise, wake up readers
        okToRead.broadcast(); // Wake up all waiting readers
    }
    lock.release();
}
```

Answer:

3. [30 points] Deadlock

1) What does a deadlock prevention mechanism do? Use an example to illustrate why this can lead to low resource utilization. (5 points)

2) Please briefly explain the two methods of deadlock recovery. (5 points)

3) Consider a system with three processes and twelve instances of one type of resource. The current resource allocation and the maximum need of each process is given below, please find a safe sequence. (5 points)

Process	Maximum Needs	Current Allocation
P0	10	5
P1	4	2
P2	9	2

4) Consider the following snapshot of a system:

	<u>Allocation</u>	<u>Max</u>	<u>Available</u>
	A B C D	A B C D	A B C D
P ₀	0 0 1 1	1 0 2 2	1 2 1 1
P ₁	3 0 4 0	5 6 6 2	
P ₂	1 0 2 0	6 4 3 1	
P ₃	1 1 0 0	1 2 2 1	
P ₄	0 4 1 1	2 4 3 3	

Answer the following questions using the banker's algorithm (15 points)

- Illustrate that the system is in a safe state by demonstrating an order in which the processes may complete. (5 points)
- If a request from process P₄ arrives for (1, 0, 0, 0), can the request be granted immediately? (5 points)

- c) If a request from process P1 arrives for (0, 1, 0, 0), can the request be granted immediately? (5 points)

4. [20 points] Memory management

- 1) Briefly describe internal and external fragmentation, and methods to mitigate the problems. (5 points)

2) Consider the following segment table:

<u>Segment</u>	<u>Base</u>	<u>Length</u>
0	0000010000000000	001011101110
1	0010000000100000	011110011110
2	0011000000000000	010100011110
3	0100000000000010	010110001100
4	1000000000001000	010100010110

Consider the following 16-bit logical addresses with 4-bit segment and 12-bit offset, what are the physical addresses of them? (15 points)

- a) 0001001011110000
- b) 0000100011101110
- c) 0010010100010000
- d) 0011010010000000
- e) 0100000100010000
